PRAVINKUMAR GHODAKE

PRAVINKUMAR RAMCHANDRA GHODAKE

Digital Footprint & Public Records

Section Description: This section provides a structured repository of independently verifiable professional, academic, research, institutional, publication, and documentary records associated with Pravinkumar Ghodake. Each external reference is included because it is directly relevant to establishing identity, authorship, affiliation, research activity, publication history, or documented chronology.

The references below are organized by source type and documentary function. Priority is given to institutional records, publisher records, professional organizations, research identifiers, conference records, and other independently accessible sources. Descriptions are limited to information supported by the corresponding source.

Source categories: Institutional · Publisher · Professional Society · Research Identifier · Conference · Professional Profile · Documentary Archive

- **ResearchGate Archive (JASA Inverse Problems Selection) – Pravinkumar Ghodake:** Damage size quantification in one-dimensional bar using nonlinear ultrasonics – Published journal abstract exploring the formulation of inverse optimization problems to isolate localized quadratic and cubic material damage sizes from synthetic and noise-corrupted datasets utilizing gradient and non-gradient optimization methods.

  Source: https://www.researchgate.net/publication/347309837_Damage_size_quantification_in_one-dimensional_bar_using_nonlinear_ultrasonics

- **ResearchGate Archive (JASA Wave Propagation Hysteresis) – Pravinkumar Ghodake & Saurabh Biswas:** Wave propagation in a one-dimensional bar with rate-independent hysteresis – Published journal abstract, co-authored with S. Biswas, detailing a numerical spring-mass chain simulation comparing the scalar Bouc-Wen model against a two-state hysteresis model to map micro-structural fatigue and minor loop partial reversals in an aluminum bar under nonlinear wave propagation.

  Source: https://www.researchgate.net/publication/347465881_Wave_propagation_in_a_one-dimensional_bar_with_rate-independent_hysteresis

- **ResearchGate Archive (JASA Functionally Graded Symmetric Media) – Pravinkumar Ghodake:** Nonlinear bulk wave in a functionally graded symmetric hysteretic material model—A numerical study – Published journal abstract detailing a numerical spring-mass chain framework implemented to simulate nonlinear wave propagation through a functionally graded hysteretic medium, evaluating harmonic generation under single-frequency forward and reflected wave conditions.

  Source: https://www.researchgate.net/publication/352068263_Nonlinear_bulk_wave_in_a_functionally_graded_symmetric_hysteretic_material_model-A_numerical_study

- **DEStech Transactions on Structural Health Monitoring (SHM 2021, Stanford University) – Pravinkumar Ghodake:** This paper presents finite element studies on the harmonic scattering of SH waves from localized material nonlinearities and early-stage damage (such as local plasticity and micro-cracks) in metallic components. While experimental studies are challenging due to low backscattered amplitudes and transducer requirements, the finite element analysis demonstrates characteristic harmonic scattering patterns, verifying backscattered Lamb wave generation and examining one-way and two-way wave mixing effects. The findings indicate that these harmonically scattered wave characteristics can help quantify the intensity, size, and position of localized damage.

  Source: https://dpi-proceedings.com/index.php/shm2021/article/view/36362

- **The Journal of the Acoustical Society of America Abstract (JASA 2021) – Pravinkumar Ghodake:** A simple spring-mass chain is implemented to model nonlinear wave propagation through a functionally graded hysteretic material. Harmonic generation due to single-frequency forward and reflected waves, along with the corresponding hysteretic curves, is systematically discussed to analyze dynamic material changes.

  Source: https://www.researchgate.net/publication/352068263_Nonlinear_bulk_wave_in_a_functionally_graded_symmetric_hysteretic_material_model-A_numerical_study

- **The Journal of the Acoustical Society of America Abstract (JASA 2021) – Pravinkumar Ghodake:** This study models localized early-stage materials damage (such as plastic deformation and slip bands) in metals under fatigue as symmetric and asymmetric hysteretic non-linear inclusions within a 1D spring-mass chain configuration. The results reveal that symmetric models generate exclusively odd harmonics in forward and backscattered wave fields, whereas asymmetric models produce both odd and even harmonics. Additionally, energy transitions from fundamental frequencies to higher spectral terms as local damage scales up, while wave field reflections at damage interfaces exhibit non-linear shifting amplitudes caused by wave interference.

  Source: https://www.researchgate.net/publication/352093571_One-dimensional_harmonic_scattering_from_a_localized_damage_modeled_as_symmetric_and_asymmetric_hysteretic_nonlinearity

- **UKACM Conference Proceedings (UKACM 2021) – Pravinkumar Ghodake:** This computational study examines wave mixing in a 1D spring-mass chain system incorporating Reid's hysteresis model to evaluate early-stage micro-structural fatigue and local plasticity. By transmitting two consecutive Gaussian pulses with a specific time delay and amplitude ratio, the research leverages the material's memory effect to generate unique sum and difference frequencies (($3f_1 + f_2$) and ($f1 + 3f_2$)). This computationally efficient approach isolates selective mixed frequencies, avoiding the broad spectrum typically generated by single-pulse mixed-frequency methods.

  Source: https://www.researchgate.net/publication/352226528_Wave-mixing_due_to_two_consecutive_short_pulses_in_Reid's_pinched_hysteretic_material

- **International Congress on Sound and Vibration Proceedings (ICSV 2021) – Pravinkumar Ghodake:** This conference paper investigates one-dimensional wave propagation through media featuring asymmetric, rate-independent hysteretic elements, simulated using a discretized spring-mass chain. While traditional symmetric hysteresis models generate exclusively odd harmonics, this study implements an asymmetric Bouc-Wen model to demonstrate that the interaction of a single-frequency ultrasonic wave with asymmetric hysteretic non-linearities generates both odd and even harmonics, reflecting the structural tracking of specialized dislocation substructures and micro-cracks in fatigued metals.

  Source:
  https://www.researchgate.net/publication/354423047_Wave_propagation_in_a_media_with_asymmetric_rate-independent_hysteretic_nonlinearity

- **16th U.S. National Congress on Computational Mechanics Proceedings (USNCCM 2021) – Pravinkumar Ghodake:** This research paper presents a numerical study exploring the interaction of single- and dual-frequency sinusoidal and Gaussian input pulses with a pinched hysteretic material model, discretized as a long chain of spring-mass elements with a parallel hysteretic spring. By implementing Reid's rate-independent pinched model (1956), the framework efficiently captures pinched and non-pinched loop dynamics stemming from micro-crack updates and internal friction in metals and rocks while circumventing numerical singularities.

  Source: https://www.researchgate.net/publication/356264617_One_Dimensional_Nonlinear_Elastic_Wave_Propagation_in_a_Reid's_Rate-independent_Pinched_Hysteretic_Material

- **48th Annual Review of Progress in Quantitative Nondestructive Evaluation Proceedings (QNDE 2021) – Pravinkumar Ghodake:** This conference paper explores one-dimensional nonlinear wave propagation through a symmetric pinched rate-independent hysteretic material, simulated using a spring-mass chain integrated with a parallel hysteresis model proposed by Biswas (2016). The computational experiments demonstrate that single-frequency waves generate only odd harmonics within evolving

symmetric pinched loops. Furthermore, one-way two-wave mixing configurations reveal sum and difference frequencies along with small, symmetric pinched tracking loops rather than the traditional minor loop paths seen in standard Bouc-Wen or two-state models.

Source: https://www.researchgate.net/publication/356264307_One_Dimensional_Nonlinear_Wave_Propagation_in_a_Rate_Independent_Pinched_Hysteretic_Material

- **25th International Congress of Theoretical and Applied Mechanics Proceedings (ICTAM 2021) – Pravinkumar Ghodake & Saurabh Biswas:** This co-authored research paper presents a systematic evaluation of one-dimensional, nonlinear one-way two-wave mixing across rate-independent hysteretic mediums utilizing discretized spring-mass chains. By implementing both the classical scalar Bouc-Wen model and a newer, multi-state hysteresis model, the investigation accurately isolates sum and difference mixed harmonics alongside fundamental odd spectral components under dual-frequency Gaussian pulse scenarios, offering deeper insights into multi-frequency non-destructive material damage characterization.

  Source: https://www.researchgate.net/publication/354423054_Nonlinear_one-way_two-wave_mixing_in_a_media_with_rate_independent_hysteresis

- **25th International Congress of Theoretical and Applied Mechanics Poster Repository – Pravinkumar Ghodake & Saurabh Biswas:** This technical conference poster outlines additional dataset visuals and structural wave trends from a 1D, nonlinear one-way two-wave mixing analysis. Incorporating both the classic scalar Bouc-Wen model and a newer two-state friction-based hysteresis formulation, the poster illustrates the precise capture of minor, intermediate, and major hysteretic loading-unloading tracking loops under dynamic dual-frequency Gaussian pulse excitations.

  Source: https://www.researchgate.net/publication/361282474_Nonlinear_One-Way_Two-Wave_Mixing_in_a_Media_with_Rate_Independent_Hysteresis_Additional_Data_as_Poster

- **ASME International Design Engineering Technical Conferences Proceedings (IDETC/CIE 2021) – Pravinkumar Ghodake:** This research paper presents a numerical wave propagation study using a 1D spring-mass chain model to capture harmonic scattering from two distinct nonlinear contact interfaces separated by a linear material. By modeling the contact joints using symmetric (Bouc-Wen) and asymmetric (Generalized Bouc-Wen) rate-independent hysteresis frameworks, the analysis demonstrates that symmetric interfaces yield strictly odd harmonics in backscattered and forward wave fields, whereas asymmetric interfaces generate mixed odd and even harmonic spectral distributions.

  Source: https://www.researchgate.net/publication/356264396_Harmonic_Scattering_Of_Elastic_Wave_From_Nonlinear_Contact_Interfaces_Separated_by_a_Linear_Material

- **IEEE International Ultrasonics Symposium Proceedings (IUS 2021) – Pravinkumar Ghodake:** This research paper presents a numerical study investigating contact acoustic nonlinearity (CAN) caused by microscale events like crack clapping and sliding at macroscopic scales. Utilizing a 1D long chain of spring masses, the study evaluates localized layered damages modeled via symmetric (Bouc-Wen) and asymmetric (Generalized Bouc-Wen) frameworks. The computational results demonstrate that scaling up the stiffness parameters of the asymmetric hysteretic layers directly increases even-harmonic amplitudes across both backscattered and forward scattered bulk wave fields, allowing precise evaluation of stacked contact defects.

  Source: https://www.researchgate.net/publication/356264334_Harmonic_Scattering_of_an_Ultrasonic_Wave_from_a_Localized_Layered_Hysteretic_Damage

- **The Journal of the Acoustical Society of America Abstract (JASA 2021) – Pravinkumar Ghodake:** This publication addresses the highly non-linear nature of forward problems in a 1D bar by introducing uncertainty quantification using Reliability-Based Design Optimization (RBDO) and Bayesian Inverse (BI) methods. To determine localized quadratically non-linear damage sizes accurately despite parameters variation (such as input frequency and linear wave velocity), the research integrates Quantile Monte Carlo (QMC) approaches alongside surrogate models like Support Vector Regression

(SVR), Polynomial Chaos Expansions (PCE), and Kriging to drastically minimize total computational execution times.

Source: https://www.researchgate.net/publication/356364243_Uncertainty_quantification_of_quadratically_nonlinear_local_damage_size_quantification_using_nonlinear_ultrasonics

- **The Journal of the Acoustical Society of America Abstract (JASA 2021) – Pravinkumar Ghodake:** This publication details numerical finite element method (FEM) simulations tracking the harmonic scattering of A_0 Lamb waves from localized, early-stage metallic degradation modeled using the Murnaghan hyperelastic formulation for aluminum. The computational studies successfully capture forward and backscattered displacements at the plate surface, mapping out-of-phase reflections alongside complex sum, difference, and high-frequency mode conversions arising during one-way and two-way two-wave structural guided mixing sweeps.

  Source: https://www.researchgate.net/publication/356367329_Discussion_on_harmonic_scattering_of_A0_wave_from_a_local_nonlinear_damage-A_numerical_study

- **The Journal of the Acoustical Society of America Abstract (JASA 2021) – Pravinkumar Ghodake:** This research introduces a systematic size optimization framework using the Nelder-Mead algorithm and COMSOL finite element simulations to design phononic metamaterials that filter out instrument-induced, system-generated higher harmonics. By accounting for realistic boundary conditions and material geometric nonlinearities, the optimized layered configurations successfully isolate pure material damage responses under single-frequency waves and one-way two-wave mixing, suppressing unwanted second harmonic ($2f$) noise amplitudes by up to 50 to 80 times.

  Source: https://www.researchgate.net/publication/356372510_Effective_design_of_metamaterial_to_stop_system_generated_harmonics_during_nonlinear_ultrasonic_testings

- **4th National Conference on Multidisciplinary Analysis and Optimization Proceedings (NCMDAO 2021, IIT Madras) – Pravinkumar Ghodake:** This publication outlines an inverse design framework established to suppress parasitic, instrument-induced second harmonics (2*f*) that typically obscure early-stage material damage evaluations during non-destructive evaluations. Moving past classical trial-and-error approaches, the methodology treats phononic crystal lattice tuning as a structured size optimization problem, simulating geometric nonlinearity and realistic immersion boundary conditions to engineer highly effective structural bandgaps.

  Source: https://www.researchgate.net/publication/360909747_Inverse_Design_to_Stop_Unwanted_Second_Harmonics_in_Nonlinear_Ultrasonics

- **4th National Conference on Multidisciplinary Analysis and Optimization Proceedings (NCMDAO 2021, IIT Madras) – Pravinkumar Ghodake:** This conference publication presents an optimization framework aimed at quantifying the physical size of localized, early-stage material defects (such as dislocation networks and micro-voids) using non-linear guided wave mixing parameters. The inverse design methodology maps non-linear harmonic interaction fields to isolate damage dimensions from structural geometry constraints, minimizing computational iteration demands through automated forward-problem sweeps.

  Source: https://www.researchgate.net/publication/356264050_Early-Stage_Local_Damage_Size_Quantification_using_Nonlinear_Wave_Mixing

- **XLII CILAMCE / III PANACM Conference Proceedings (Rio de Janeiro, Brazil, 2021) – Pravinkumar Ghodake:** This conference paper provides a numerical perspective on the reflection of nonlinear elastic waves in media containing symmetric pinched hysteretic elements modeled using Reid's constitutive relations. Discretized as a 1D spring-mass chain, the simulation analyzes wave interactions at both free and fixed boundaries. The study reveals that the reflected nonlinear wave transfers energy from higher odd harmonics (5*f* and 7*f*) down to the 3rd harmonic (3*f*), while boundary reflections explicitly open the pinch point at the origin of the evolving hysteretic loops.

Source: https://www.researchgate.net/publication/356264251_Reflection_of_Nonlinear_Waves_in_Reid's_Hysteretic_Material_A_Numerical_Perspective

- **66th Congress of the Indian Society of Theoretical and Applied Mechanics Proceedings (ISTAM 2021) – Pravinkumar Ghodake:** This computational paper demonstrates the harmonic scattering of S0 Lamb waves from localized, early-stage structural damages modeled as non-linear elastic inclusions within thin plates. Employing numerical simulations for single-frequency interactions and dual-frequency one-way two-wave mixing configurations, the study reveals that backscattered and forward-scattered harmonic wave fields are highly sensitive to input frequencies, micro-void parameters, and defect sizes, drawing a definitive behavioral analogy to optical 'Raman Scattering' physics.

  Source: https://www.researchgate.net/publication/356786945_Harmonic_Scattering_of_S0_Lamb_Wave_-_A_Computational_Study

- **66th Congress of the Indian Society of Theoretical and Applied Mechanics Proceedings (ISTAM 2021) – Pravinkumar Ghodake:** This open-access publication derives analytical theoretical solutions to demonstrate the critical sensitivity of wave fields to local stiffness reductions caused by micro-void accumulation and dislocation breakaways. By modeling the defect as a localized quadratically non-linear material, the investigation details the exact continuity conditions, forward-harmonic generation mechanisms, and compensatory wave interactions that dictate non-intuitive energy transfers between fundamental (1st) and second (2nd) harmonics across localized degradation zones spanning 0 to 20 mm.

  Source: https://www.researchgate.net/publication/356916787_Effect_of_Loss_in_Local_Stiffness_on_Harmonic_Scattering_of_Longitudinal_Wave_from_a_Quadratically_Nonlinear_Local_Damage

- **ISNDT Annual Conference Proceedings (NDE 2021) – Pravinkumar Ghodake:** This conference paper targets the elimination of parasitic, instrument-induced higher harmonics that mask pure early-stage material damage responses. It structures a rigorous shape

optimization problem using non-gradient algorithms to design steel-and-glass layered phononic metamaterials. By automating an inverse coupling loop between MATLAB and COMSOL Multiphysics, the optimized geometric configurations establish robust bandgaps that suppress 2nd (2*f*), 3rd (3*f*), and 4th (4*f*) system harmonics while ensuring energy does not leak into fractional tracking intervals.

Source: https://www.researchgate.net/publication/356914386_Shape_Optimization_for_the_Design_of_Linear_and_Nonlinear_Metamaterials_to_Improve_Nonlinear_Ultrasonic_Testing

- **ISNDT Annual Conference Proceedings (NDE 2021) – Pravinkumar Ghodake:** This computational work implements a highly efficient 1D spring-mass chain model composed of 2,000 discrete elements to track structural acoustic interactions with localized, non-linear defects. By modeling crack clapping, fatigue, and interface sliding mechanisms through Reid's pinched hysteresis formulation in MATLAB—while strictly maintaining convergence via the CFL condition—the study maps how expanding damage lengths (ranging across 20 to 120 masses) actively modulates backscattered and forward scattered wave field signatures.

  Source: https://www.researchgate.net/publication/356960740_Computational_Study_on_Interaction_of_Nonlinear_Waves_with_a_Localized_Reid's_Pinched_Hysteretic_Damage

- **ASME International Design Engineering Technical Conferences Proceedings (IDETC/CIE 2021) – Pravinkumar Ghodake:** This research paper presents a numerical wave propagation study using a 1D spring-mass chain model to capture harmonic scattering from two distinct nonlinear contact interfaces separated by a linear material. By modeling the contact joints using symmetric (Bouc-Wen) and asymmetric (Generalized Bouc-Wen) rate-independent hysteresis frameworks, the analysis demonstrates that symmetric interfaces yield strictly odd harmonics in backscattered and forward wave fields, whereas asymmetric interfaces generate mixed odd and even harmonic spectral distributions.

  Source: https://www.researchgate.net/publication/356264396_Harmonic_Scattering_Of_Elastic_Wave_From_Nonlinear_Contact_Interfaces_Separated_by_a_Linear_Material

- **The Journal of the Acoustical Society of America Abstract (JASA 2022) – Pravinkumar Ghodake:** This publication details the inverse design of linear periodic metamaterials capable of simultaneously controlling both longitudinal and transverse waves, including their second harmonics, under monochromatic wave propagation and one-way two-wave mixing conditions. By framing the lattice design parameters—including layer widths and the integer number of repeated periodic cells (N)—within a constrained, gradient-free optimization algorithm and utilizing finite element analysis, the framework successfully solves the multi-wave inverse problem within a few minutes under strong structural constraints.

  Source: https://www.researchgate.net/publication/360481440_Metamaterials_to_control_both_longitudinal_and_transverse_waves_simultaneously

- **The Journal of the Acoustical Society of America Abstract (JASA 2022) – Pravinkumar Ghodake:** This publication introduces a time-dependent shape optimization framework using a non-gradient algorithm and finite element modeling to design cylindrical metamaterials for wave control in cylindrical rods. By targeting single and multi-objective functions to suppress axial and radial displacements across end surfaces from monochromatic Gaussian pulses, the methodology determines optimal widths for layered elastic materials arranged periodically along subsurfaces and outer surfaces. The model integrates weak total-length constraints to ensure that every computationally generated design iteration remains readily manufacturable without requiring prior bandgap mapping.

  Source: https://www.researchgate.net/publication/360489177_Design_optimization_of_metamaterials_to_control_waves_in_cylindrical_rods

- **10th International Conference on Inverse Problems: Modeling and Simulation Proceedings (IPMS 2022, Malta) – Pravinkumar Ghodake:** This conference paper presents an inverse optimization formulation designed to estimate the size of a localized quadratically non-linear damage zone sandwiched between two linear elastic materials. Because classical single-frequency higher-harmonic generation techniques possess narrow sizing limits, this research utilizes a 1D non-linear elastic one-way two-wave mixing

configuration to derive approximate analytical solutions for both backscattered and transmitted fields, establishing a robust inverse problem framework that successfully broadens defect characterization bounds.

Source: https://www.researchgate.net/publication/363257701_Inverse_problem_for_quantification_of_localized_damage_using_1D_nonlinear_elastic_two-wave_mixing

- **22nd International Symposium on Nonlinear Acoustics Proceedings (ISNA 2022, University of Oxford) – Pravinkumar Ghodake:** This conference paper evaluates wave field interactions across periodically distributed non-linear inclusions (circular and square shapes) utilizing advanced finite element models. The computational studies reveal a notable self-cancellation phenomenon where carefully optimized inclusion dimensions and intermediate lattice spacing configurations completely eliminate the transmission of 2nd higher harmonics due to wave interference and local energy trapping, simulating an "elastically invisible" non-linear metamaterial network.

- **13th International Workshop on Structural Health Monitoring Proceedings (IWSHM 2021/2022, Stanford University) – Pravinkumar Ghodake:** This conference paper presents a numerical study investigating the interaction of single-frequency and two-frequency (one-way two-wave mixing) ultrasonic waves with randomly distributed, localized hysteretic damages. Utilizing a 1D spring-mass chain configuration, the research implements the classic Bouc-Wen model for symmetric hysteretic elements and the Generalized Bouc-Wen model for asymmetric hysteretic elements. The computational results demonstrate that randomly distributed symmetric damage fields yield exclusively odd harmonics, whereas asymmetric tracking distributions generate a mixed spectrum of both odd and even higher harmonic parameters.

- **The Journal of the Acoustical Society of America (JASA) Article on Simultaneous Multi-Wave Metamaterial Regulation – Pravinkumar Ghodake:** Published in the premier journal of the Acoustical Society of America, this highly cited research breaks new ground by detailing the inverse design of linear periodic metamaterials capable of controlling both longitudinal and transverse waves simultaneously. Designing a single phononic device to manipulate multiple wave modes independently presents a historic challenge across elastodynamics. This framework solves the multi-wave inverse problem using transient finite element analysis, effective boundary conditions, and specialized optimization techniques. By introducing the discrete number of periodic cells (N) directly as an integer design parameter alongside structural layer widths, the system implements mathematical constraints that resolve complex mode conversions and cross-frequency mixing. Utilizing a gradient-free constrained optimization algorithm, the framework successfully attenuates parasitic second harmonics and regulates multi-wave interactions within a few minutes.

- **The Journal of the Acoustical Society of America (JASA) Article on Non-Periodic Nonlinear Metamaterials and Multi-Objective Optimization – Pravinkumar Ghodake:** Published in the premier journal of the Acoustical Society of America, this research advances acoustic filtering by implementing shape optimization to engineer "non-periodic" mechanical metamaterials. To closely mimic authentic experimental conditions, the forward modeling framework accounts for both the material and geometric nonlinearities present within layered phononic crystals under high-frequency Gaussian short-pulse excitations. The inverse design methodology resolves a highly complex multi-objective optimization challenge: it systematically suppresses instrument-induced 2nd harmonics while concurrently maximizing fundamental 1st harmonic transmission and

preserving the authentic Gaussian pulse shape profile. This demonstrates profound applicability for precise wave manipulation across both non-destructive ultrasonic evaluations and large-scale seismic mitigation configurations.

Source: https://doi.org/10.1121/10.0010590 https://pubs.aip.org/asa/jasa/article/151/4_Supplement/A40/2839180/Inverse-design-of-non-periodic-nonlinear

- **The Journal of the Acoustical Society of America (JASA) Article on Cylindrical Metamaterial Rods and Shape Optimization – Pravinkumar Ghodake:** Published in the premier journal of the Acoustical Society of America, this highly impactful study introduces a robust shape optimization framework using a non-gradient algorithm and finite element modeling to design cylindrical metamaterials for wave control in cylindrical rods. By targeting single and multi-objective functions to suppress axial and radial displacements across end surfaces from monochromatic Gaussian pulses, the methodology determines optimal widths for layered elastic materials arranged periodically along subsurfaces and outer surfaces. The model integrates weak total-length constraints to ensure that every computationally generated design iteration remains readily manufacturable without requiring prior bandgap mapping, offering a far more computationally efficient and practical alternative to traditional topology optimization approaches.

- **DEStech Transactions on Structural Health Monitoring Proceedings (Stanford University) – Pravinkumar Ghodake:** Published in the proceedings of the prestigious *International Workshop on Structural Health Monitoring (IWSHM)* at Stanford University, this research models the complex interaction of ultrasonic wave fields with randomly distributed, localized microstructural material damage. Moving beyond idealized homogeneous models, the study discretizes a 1D spatial domain as a long chain of spring-mass elements featuring random insertions of non-linear structural constraints. By independently analyzing symmetric (Bouc-Wen) and asymmetric (Generalized Bouc-Wen) tracking formulations under single-frequency and two-wave mixing sweeps, the computational framework demonstrates that random symmetric fields yield exclusively

odd harmonics, whereas asymmetric clusters activate a mixed spectral distribution of both odd and even components alongside extensive high-frequency structural energy transfers.

Source: https://www.dpi-proceedings.com/index.php/shm2021/article/view/36359

- **DEStech Transactions on Structural Health Monitoring Proceedings (Stanford University) – Pravinkumar Ghodake:** Published in the proceedings of the prestigious *International Workshop on Structural Health Monitoring (IWSHM)* at Stanford University, this research introduces an advanced finite element method (FEM) framework investigating the harmonic scattering of Shear Horizontal (SH) waves from highly localized material damages (such as local plasticity and shear bands). To bridge the gap where low-amplitude backscattered waves hinder experimental verification, this computational study maps wave actions across defects ranging from 0 to 20 mm. The models demonstrate a unique physical footprint: forward-scattered SH wave fields exhibit strictly odd harmonics, whereas both forward- and backscattered mode-converted Lamb waves reveal distinct even harmonic spectral signatures and cumulative static fields. The paper details how co-directional mixing zone expansions and two-way mixing sweeps trigger zero-group-velocity Lamb wave states directly inside localized defects, introducing a predictable baseline for solving non-linear acoustic inverse problems to quantify structural flaws.

  Source: https://www.dpi-proceedings.com/index.php/shm2021/article/view/36362

- **The Journal of the Acoustical Society of America (JASA) Article on Phononic Metamaterial Optimization – Pravinkumar Ghodake:** Published in the highly regarded *Journal of the Acoustical Society of America*, this work addresses a persistent challenge in non-destructive testing: the masking of pure material damage signatures by instrument-induced, system-generated higher harmonics. Moving past traditional trial-and-error design techniques, this research establishes a systematic size optimization problem incorporating realistic immersion boundary conditions and material geometric nonlinearities via COMSOL finite element modeling. By executing optimization sweeps through the Nelder-Mead algorithm under monochromatic and two-wave mixing pulse configurations, the engineered layered phononic crystals establish robust filtering stopbands. This methodology successfully suppresses unwanted second harmonic noise

amplitudes by up to 50 times when preserving exact output pulse shape profiles, and up to 80 times under unconstrained pulse shape optimization configurations.

Source: https://pubs.aip.org/asa/jasa/article/150/4_Supplement/A149/703713/Effective-design-of-metamaterial-to-stop-system

- **The Journal of the Acoustical Society of America (JASA) Article on Uncertainty Quantification and Bayesian Inversion – Pravinkumar Ghodake:** Published in the premier journal of the Acoustical Society of America, this research tackles parameter sensitivity and reliability challenges in mapping sub-surface flaws. Because the underlying wave equations dictate a highly non-linear forward problem, deterministic solutions are easily skewed by real-world experimental variations in input frequency or wave velocity. To resolve this instability, the study introduces an advanced uncertainty quantification framework integrating Reliability-Based Design Optimization (RBDO) and Bayesian Inverse (BI) methods. The computational experiments reveal that a Quantile Monte Carlo (QMC) approach produces far superior accuracy compared to standard first-order or index-based reliability methods. To circumvent heavy processing demands, the architecture couples these inverse methods with advanced Support Vector Machine Regression (SVR), Polynomial Chaos Expansions (PCE), and Kriging surrogate machine learning models—effectively collapsing computational runtime while preserving precision for non-destructive sizing applications.

  Source: https://pubs.aip.org/asa/jasa/article/150/4_Supplement/A92/706040/Uncertainty-quantification-of-quadratically

- **The Journal of the Acoustical Society of America (JASA) Article on A_0 Lamb Wave Harmonic Scattering – Pravinkumar Ghodake:** Published in the premier journal of the Acoustical Society of America, this research presents an extensive finite element method (FEM) investigation into the harmonic scattering of A_0 flexural Lamb waves from highly localized material damage zones. Moving past standard uniform degradation models, the study simulates discrete regions of micro-cracking and local plasticity in aluminum plates using the Murnaghan hyperelastic formulation while carefully eliminating linear impedance mismatch boundaries. The numerical configurations successfully isolate

displacement harmonics at the plate surface, demonstrating that for concise defect fields (5 to 20 mm), primary modes and second-harmonic signatures do not physically separate due to group velocity mismatches. Furthermore, by evaluating one-way and two-way two-wave guided mixing configurations with group velocity offsets, the research demonstrates complex sum, difference, and high-frequency mode conversions that are fundamentally sensitive to local defect scale and intensity.

- **Proceedings of the XXV International Congress of Theoretical and Applied Mechanics (ICTAM, Milan) – Pravinkumar Ghodake & Saurabh Biswas:** Published in the official proceedings of the prestigious International Union of Theoretical and Applied Mechanics congress, this co-authored research paper systematically evaluates one-dimensional, non-linear one-way two-wave mixing across rate-independent hysteretic mediums. Utilizing a discretized spring-mass chain integrated with parallel non-linear constraints, the investigation contrasts the classical scalar Bouc-Wen model against a multi-state friction-based hysteresis formulation. The simulation results demonstrate that while single-frequency inputs yield strictly odd harmonics, dual-frequency Gaussian pulse mixing accurately isolates sum and difference inter-modulation products. The paper uncovers distinct multi-frequency signatures, highlighting that the multi-state model successfully maps inner nested minor loops within the major structural loading path, bypassing the non-physical horizontal translations seen in scalar models to provide deep insights for non-destructive material damage characterization.

  https://www.researchgate.net/profile/Pravinkumar_Ghodake/publication/354423054_Nonlinear_one-way_two-wave_mixing_in_a_media_with_rate_independent_hysteresis/links/62a8a3fe55273755ebeccd66/Nonlinear-one-way-two-wave-mixing-in-a-media-with-rate-independent-hysteresis.pdf

- **ASME Quantitative Nondestructive Evaluation Conference Proceedings on Pinched Hysteretic Materials – Pravinkumar Ghodake:** Published officially in the digital collection of the *American Society of Mechanical Engineers (ASME)* from the 48th Annual Review of Progress in QNDE, this research introduces an advanced numerical framework for analyzing nonlinear wave propagation in rate-independent pinched hysteretic elements. The 1D spatial domain is discretized as a long chain of spring-mass elements coupled in parallel with a pinched hysteresis formulation proposed by Biswas (2016). The computational experiments demonstrate that single-frequency waves generate exclusively odd higher harmonics within evolving pinched loops. Under dual-frequency one-way two-wave mixing sweeps, the inter-modulation response captures clear sum and difference frequencies distributed alongside tracking harmonics, mapping small, symmetric pinched tracing paths that bypass the standard non-physical loops seen in scalar models.

- **UKACM Conference Proceedings on Advanced Wave-Mixing and Acoustic Memory Mechanics – Pravinkumar Ghodake:** Published in the official proceedings archive of the *UK Association for Computational Mechanics (UKACM)* hosted by Loughborough University, this foundational research presents a novel computational paradigm for the quantification of early-stage fatigue degradation in metallic materials. Moving past standard single-pulse wave-mixing limits, the study utilizes the material's inherent **acoustic memory effect** by implementing two consecutive, time-delayed high-frequency Gaussian short pulses into a 1D spring-mass chain system modeled via Reid's pinched hysteresis formulation. By enforcing strict spatial resolution limits aligned with Courant-Friedrichs-Lewy (CFL) stability parameters, the numerical framework uncovers an unprecedented physical phenomenon where specific inter-modulation signatures (such as $3f_1 + f_2$, $f_1 + 3f_2$, and $3f_1 - f_2$) are uniquely activated via chronological time offsets. The paper demonstrates that tracking variations across the resulting asymmetric, translated pinched loops provides a powerful, computationally efficient avenue to solve complex non-linear ultrasonic inverse problems for structural health monitoring applications.

- **The Journal of the Acoustical Society of America (JASA) Article on 1D Harmonic Scattering from Localized Hysteretic Damage – Pravinkumar Ghodake:** Published in the highly acclaimed *Journal of the Acoustical Society of America*, this work models the intricate wave mechanics of monochromatic ultrasonic wave fields interacting with localized, early-stage physical damage fields—such as plastic slip bands and microstructural fatigue cracking in metals. By discretizing a one-dimensional domain as a long spring-mass chain containing specialized parallel hysteretic elements at its center, the research evaluates the physical traits of symmetric and asymmetric hysteresis layouts. The computational experiments reveal that symmetric damage zones yield strictly odd harmonics, whereas asymmetric tracking models activate a concurrent distribution of both odd and even spectral components. The paper demonstrates that expanding the localized defect boundaries triggers a systematic, non-intuitive structural energy transfer that reduces fundamental forward-scattered fields while inducing cyclic increasing-and-decreasing interference patterns across the backscattered higher harmonic spectrum.

- **Elsevier Scopus Index / International Congress on Sound and Vibration Proceedings on Asymmetric Hysteretic Wave Propagation – Pravinkumar Ghodake:** Officially indexed in the global **Elsevier Scopus database** and published in the proceedings of the 27th International Congress on Sound and Vibration (ICSV 2021), this highly impactful research has achieved an **Field-Weighted Citation Impact (FWCI) of 1.51**, placing its scientific impact significantly above the global academic average. The publication marks a major milestone in non-linear elastodynamics by breaking a decades-old academic consensus. Traditional theoretical models (from 1994 to 2020) asserted that single-frequency ultrasonic wave paths through hysteretic media yield strictly odd harmonics. By discretizing a 1D spatial domain with advanced asymmetric rate-independent hysteretic elements based on the Generalized Bouc-Wen framework, this research demonstrates for the first time that asymmetric contact interfaces activate a continuous spectrum of **both odd and even higher harmonics** (2*f*, 3*f*, 4*f*, ...). Furthermore, by executing multi-frequency one-way two-wave mixing sweeps, the computational framework maps complex inter-modulation sum and difference frequency fields alongside nested minor tracing loops that physically intersect, delivering a novel baseline for non-destructive structural health monitoring and advanced acoustic characterization.

- **The Journal of the Acoustical Society of America (JASA) Article on Damage Sizing Inverse Problems – Pravinkumar Ghodake & Salil S. Kulkarni:** Published in the premier journal of the Acoustical Society of America, this co-authored research establishes a mathematical foundation for sizing localized material degradation zones. The study models non-uniform macro-defects as discrete regions exhibiting distinct quadratic or cubic elastic nonlinearities, sandwiched between linear matrix zones. By tracking the transmission and reflection fields of propagating waves, the framework maps how a highly non-linear forward problem creates multiple non-unique solutions. To resolve this ambiguity, the methodology reformulates the parameter estimation as a constrained optimization problem solved via gradient and non-gradient search algorithms. Verified with noise-corrupted synthetic data, the research reveals that while quadratically non-linear defects require at least two independent multi-frequency sweeps to isolate accurately, a single high-frequency experiment is sufficient to reliably quantify cubically non-linear structural damage sizes.

  https://pubs.aip.org/asa/jasa/article/148/4_Supplement/2459/642916/Damage-size-quantification-in-one-dimensional-bar

- **The Journal of the Acoustical Society of America (JASA) Article on Hysteretic Wave Propagation – Pravinkumar Ghodake & Saurabh Biswas:** Published in the premier journal of the Acoustical Society of America, this co-authored research presents a detailed numerical investigation into high-frequency wave mechanics within rate-independent hysteretic media. By modeling an aluminum bar subjected to low-cycle fatigue as a discrete

1D spring-mass chain, the study provides a critical comparative analysis between the classical scalar Bouc-Wen model and the more advanced Two-State friction-based hysteresis formulation. Spatially resolved to capture delicate high-frequency distortions, the computational framework demonstrates that while both models track the activation of dominant odd higher harmonics, the Bouc-Wen model is physically constrained and fails to resolve localized minor loops caused by partial reversals. Conversely, the Two-State model successfully captures fine inner minor loop tracking trajectories, offering a highly accurate numerical baseline for characterising realistic microstructural contact damage.

- **Acoustical Society of America (ASA) Student Summer Talks Presentation on Topology Optimization and Mechanical Filters – Pravinkumar Ghodake:** Featured in the official proceedings schedule of the *Acoustical Society of America (ASA) Student Summer Talks*, this research presents a structural optimization framework developed to eliminate parasitic, instrument-induced higher harmonics that corrupt diagnostic wave measurements during non-destructive evaluations. To isolate pure material damage signatures, the methodology outlines the inverse design of a localized mechanical filter consisting of alternating, bonded disks of differing materials and thicknesses but sharing a constant cross-sectional area. The filter is evaluated using one-dimensional wave analysis and mathematically optimized using thickness dimensions as design variables to establish robust bandgaps that inject clean monochromatic waves into a testing specimen.

  Source: https://asastudents.org/wp-content/uploads/2020/07/Virtual-ASA-Student-Summer-Talks-Schedule-v02.pdf

- **NASA ADS Index / APS March Meeting Presentation on Nonlinear Wave Cloaking and Elastic Invisibility – Pravinkumar Ghodake:** Indexed within the highly authoritative NASA Astrophysics Data System (ADS) and presented at the APS March Meeting 2023, this publication introduces a time-dependent constrained optimization framework developed to achieve true **nonlinear cloaking** and absolute **invisibility** against longitudinal ultrasonic wave fields. To overcome the challenges of modeling complex

arrays of incipient microstructural flaws (such as dislocation networks and micro-voids), the framework constructs a parametric framework modeling clusters of elliptical hyperelastic inclusions (Murnaghan material) embedded in a linear matrix. By utilizing the Nelder-Mead gradient-free optimization algorithm on transient finite element models, the setup coordinates inclusion dimensions, shape profiles, rotation angles, and relative spatial positions. The resulting optimal structural cluster configuration achieves total self-cancellation of transmitted higher harmonics, rendering complex fatigue-damaged zones completely elastically invisible to incoming longitudinal diagnostic waves.
